1.0 Introduction

1.1 Purpose of this document

The purpose of this document is to document the technical design, component details and Database design. This will also capture the scope, assumptions, risk, dependencies of this project. This document provides an overview about the business need and the solution that can be provided to fulfil the objective.

1.2 Project overview

The purpose of this Pharmacy Management System project is to improve the maintenance and manipulation of the drugs in the medicals. The pharmacy management system will be used to minimize the time and resource by maintaining the details of the drug systemically so that the data can be used in possible quickest time. While the resource which is minimized are workforce, money, papers, etc. The system is user-friendly and will help the pharmacist. This Pharmacy Management System will reduce the burden on pharmacist and will make the system efficient by providing the more accurate details about drugs in the medical.

2.0 Solution Summary

2.1 Scope

- This Project “Pharmacy Management System” is a solution to Pharmacy Organizations to take the orders from its distributors who are geographically distributed.
- This system is a complete web-based application for managing a pharmacy organization’s entire operation.
- No need to own any computer for this specific ordering of products, it just requires user to register with the system.
- It provides easy to use and user-friendly interface for the user. The user, vendor can access the system at any time, because it’s 24-hour availability.

2.2 Assumptions

- The purpose of this Pharmacy Management System project is to improve the maintenance and manipulation of the drugs in the medicals. The pharmacy management system will be used to minimize the time and resource by maintaining the details of the drug systemically
- End user having enough knowledge for the project operation.
 - Users must have basic knowledge of computer system and English language.

2.3 Dependencies

- Admin can't disapprove the user if it allowed it once or vice versa.
- Vendors can't retrieve order id of admin which is already been approved or rejected.
- Users can't auto register themselves

2.4 Risks

No risk encountered

3.0 Schematic Diagram

A schematic, or schematic diagram, is a representation of the elements of a system using abstract, graphic symbols rather than realistic pictures. It gives an overview of overall system

4.0 System Design

4.1 Proposed design

After planning and requirement specification the following functionalities and scheme is proposed:

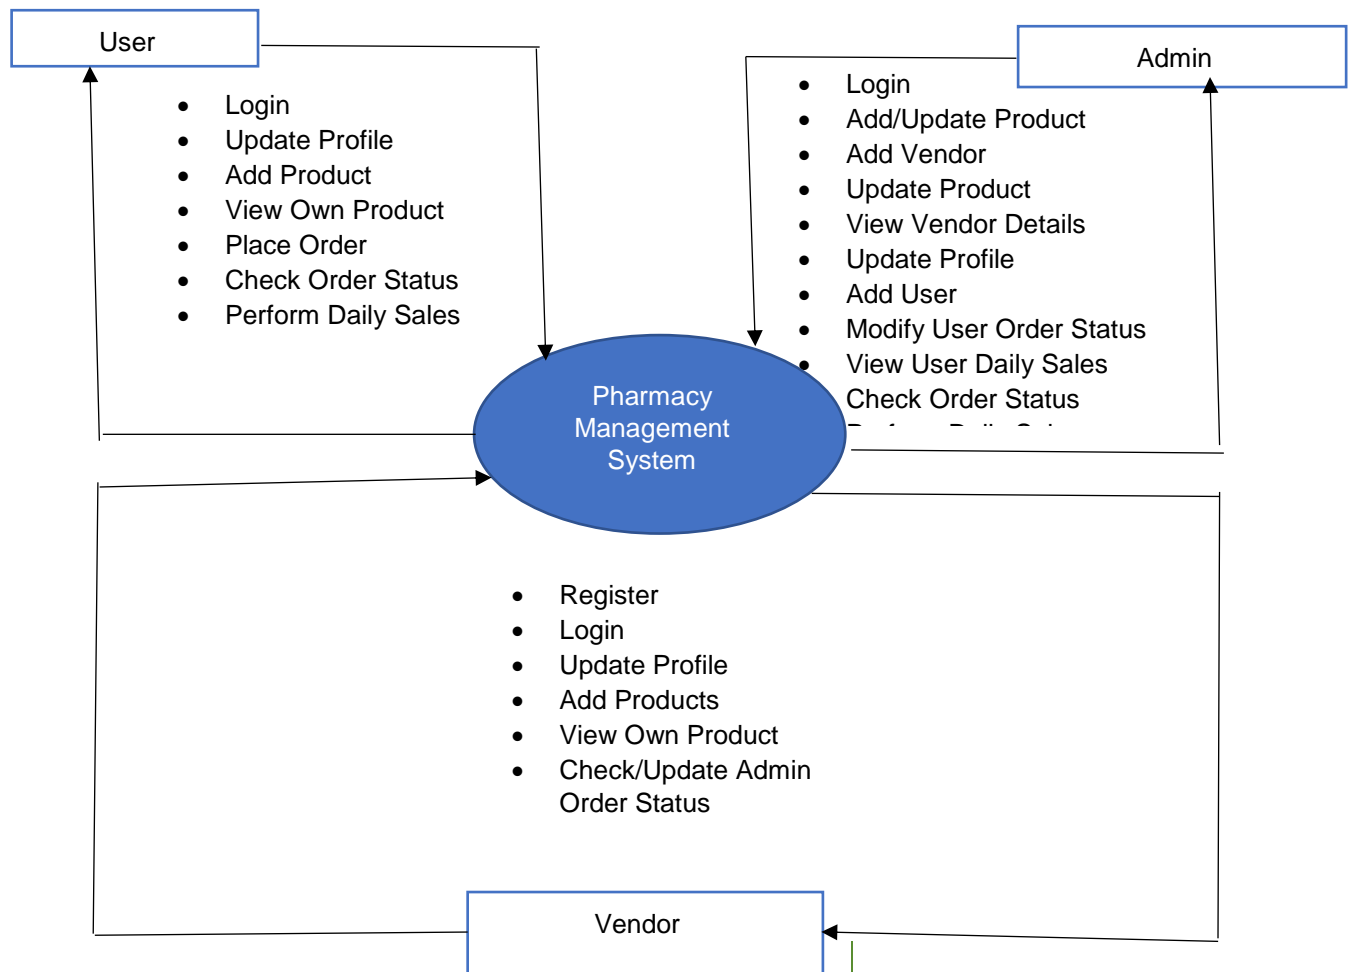

- a. No users can auto register themselves
- b. Only registered user can add login into application
- c. User can view and purchase products.
- d. User can update their profile and check the products to order for themselves.
- e. An Admin has some extra privilege like it can register new users, can check orders of vendor and user
- f. Admin can add products, edit product information and add/remove product.
- g. Admin can add user, view transactions of user, vendor, approve vendor etc.
- h. Vendor can approve admin order, update own profile, check own products, and can add new product's.

4.2 Component inventory

- **Backend:** Java, Servlet, JDBC
- **Frontend:** HTML, CSS, JSP
- **Application Architecture:**
 1. UI- JSP, CSS
 2. Service Layer- Jsp Servlet
 3. Back-end - Java
 4. Database - MySQL
 5. Development Tool – NetBeans
